EDUCATION

University of Bristol

BSc Computer Science, First Class Honours

Sep 2022 – Jun 2025

EXPERIENCE

Software Engineer

Dassault Systèmes

Jun 2025 – Present

- Led the design and development of a natural-language interface for enterprise workflow automation, enabling schedule analysis, conflict detection, resource validation, and task rescheduling for construction planning workflows.
- Designed and implemented a Python-based workflow execution framework integrating LLM reasoning, retrieval, and tool orchestration to automate complex multi-step platform operations.
- Owned end-to-end delivery of an AI-powered proof-of-concept from architecture and implementation through technical validation, securing stakeholder approval through iterative demonstrations and feedback cycles.
- Developed production-ready web application features using React and TypeScript, modernizing native platform workflows into scalable and maintainable web-based solutions.
- Implemented and maintained core platform functionality in C++, delivering new features and resolving system-level issues through root-cause analysis and debugging.

Research Assistant

Hanyang University

Jul 2024 – Sep 2024

- Implemented VR locomotion systems in Unity, integrating vibrotactile feedback and omnidirectional treadmill input for controlled experimental studies.
- Designed and conducted two experimental conditions (static controller-based steering and dynamic walking), managing participant sessions and data collection for 80 subjects.
- Analysed quantitative cybersickness, task load, and presence metrics, collaborating with researchers to interpret results and refine experimental design.

Project Co-Creator

Royal Academy of Engineering

Oct 2023 – Mar 2024

- Co-created and facilitated workshops for the Ca-Pow! Project, supporting intersectionally disadvantaged students and addressing barriers to higher education.
- Led mentor training sessions on inclusive practices, strengthening support structures for underrepresented students.

PUBLICATIONS

Do Vibrotactile-Rendered Virtual Walking Sensations Reduce VR Cybersickness?

- Co-authored a peer-reviewed paper accepted at the **IEEE International Symposium on Mixed and Augmented Reality (ISMAR 2025)**.
- Demonstrated that vibrotactile feedback simulating virtual walking significantly reduced VR cybersickness across static and dynamic locomotion conditions without increasing task load or reducing presence.

PROJECTS

LLM-Based Geometric Path Planning for Indoor Navigation | *Final Year Project*

- Built an experimental pipeline for indoor navigation reasoning using 2D floorplans and Oriented Bounding Box (OBB) data, enabling systematic evaluation of LLM-generated navigation paths.
- Evaluated zero-shot and few-shot prompting for geometric reasoning by defining path-quality metrics and identifying failure modes against classical path-planning baselines.

Haunted Escape — GameJam 2024 Winner (Best Visuals)

- Designed and implemented 15 progressively challenging stages featuring dynamic traps and AI-driven enemy behaviour.
- Recognized for outstanding visual design, atmosphere, lighting, and environmental storytelling.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, C++, Java, C#, Go, SQL

Web & Backend: React, Node.js, FastAPI, REST APIs

Tools & Platforms: AWS, Git, Linux
